# The EFMARE project is an extension of the NKS project

## "Consequences of severe radioactivity releases to Nordic marine environment (COSEMA)"

Statens strålevern  
Norwegian Radiation Protection Authority

### Scenarios:

1. Nuclear power plant accident
2. Modern Russian operative submarine accident

**Marine regions:**  
Iceland coastal waters

Faroe Islands  
Norwegian Current  
Baltic Sea

Kattegatt

Finish and Swedish  
coastal waters

# Accident release scenarios

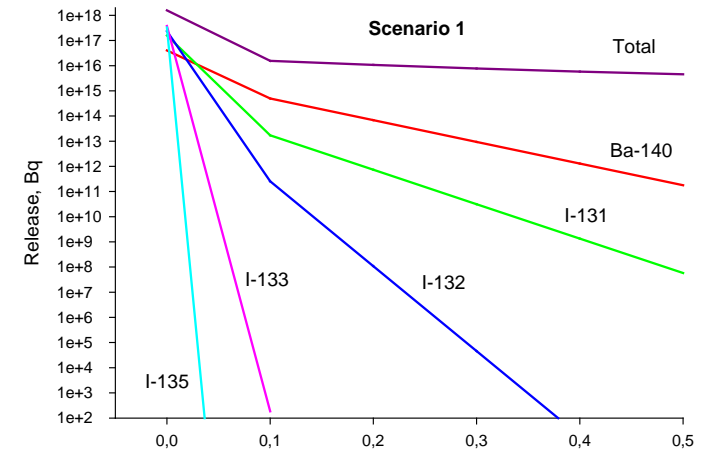

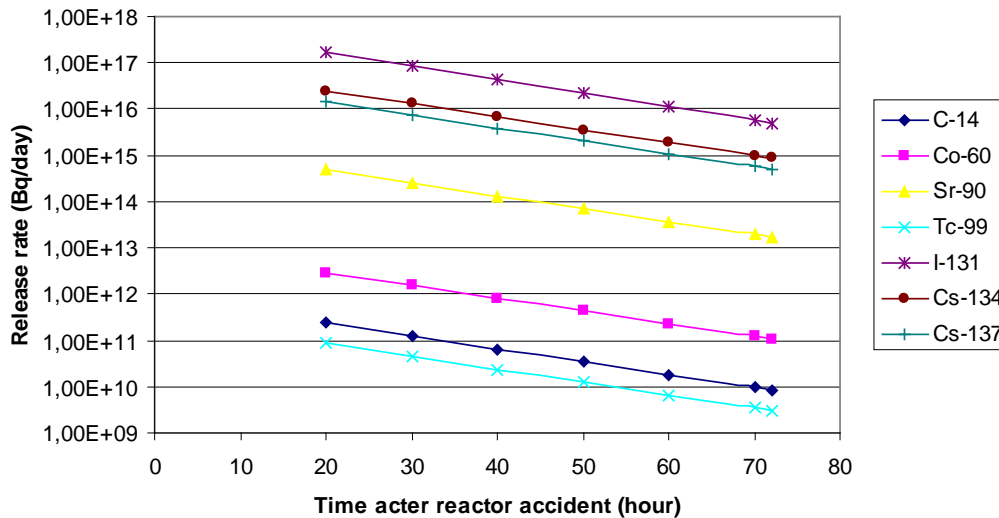

Statens strålevern  
Norwegian Radiation Protection Authority

## Submarine accident (Reisted, 2008)

## Nuclear power plant accident (COSEMA, 2013)

Short-term release (3 days) to sea

## Consequences after the release of radionuclides :

- dispersion of radionuclides in water and sediment phases
- bioaccumulation of radionuclides in biota
- doses for human and marine organisms.

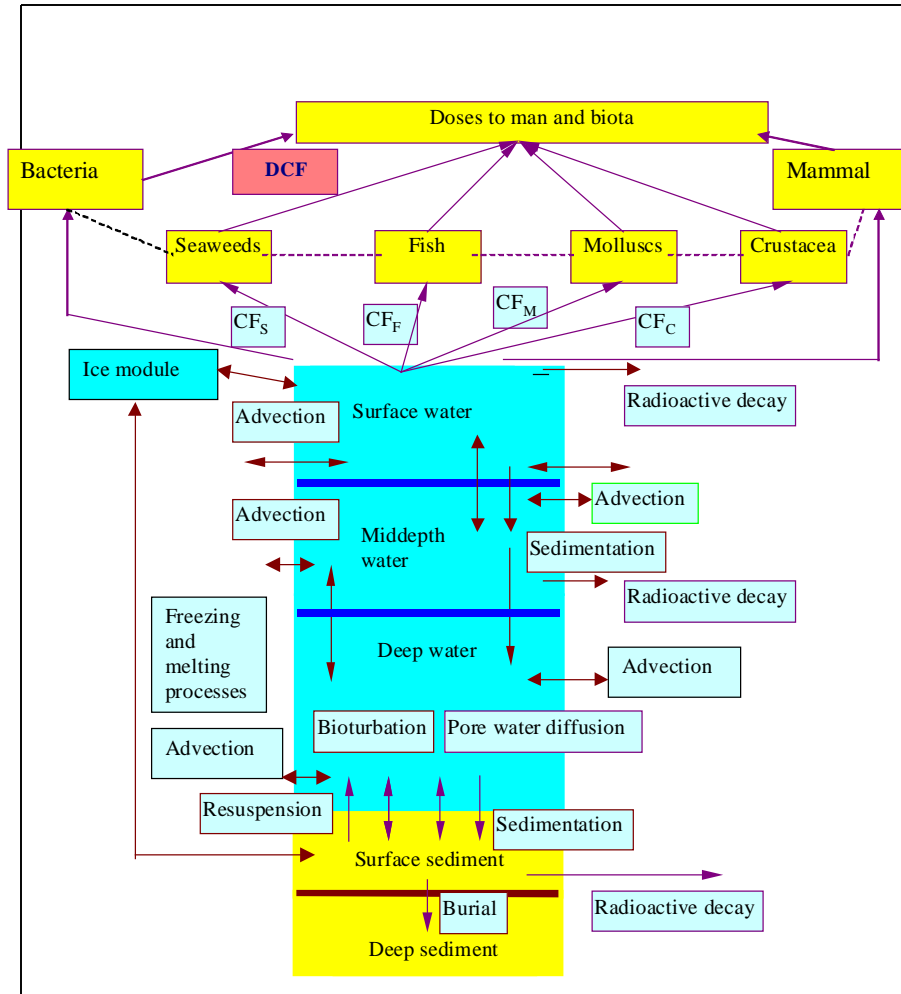

# Models

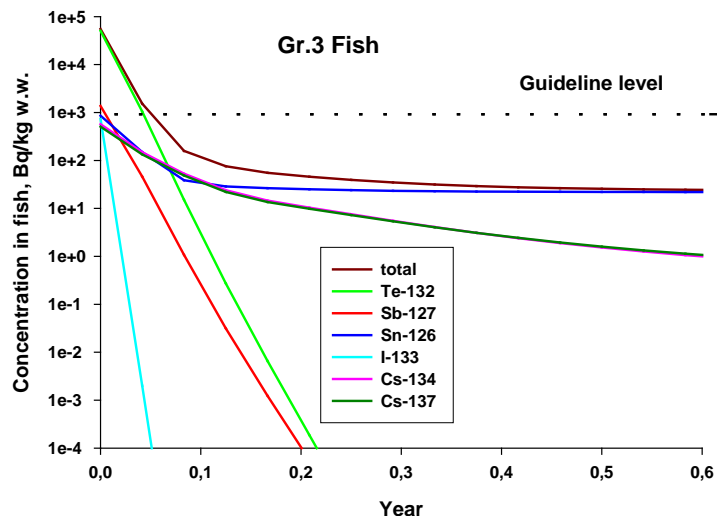

- **3D Hydrodynamic numerical ocean model CODE**
- **VTT's DETRA computer code**
- **NRPA box model**
- **Regional Iceland box model for the Iceland coastal waters**

# The NRPA and regional Iceland compartment models

# Case study: submarine accident. The end point example

**Concentration in fish**

**Dose to the critical group  
(mainly from fish): 0.11 mSv**

**( $D_{min}$  = 0.009 mSv and  $D_{max}$  = 2.4 mSv)**

$^{238}\text{Pu}$ ,  $^{239}\text{Pu}$ ,  $^{240}\text{Pu}$ ,  $^{241}\text{Am}$ ,  $^{241}\text{Pu}$ ,  $^{244}\text{Cm}$ ,  $^{131}\text{I}$ ,  $^{90}\text{Sr}$ ,  $^{106}\text{Ru}$ ,  $^{134}\text{Cs}$ ,  $^{137}\text{Cs}$ ,  
 $^{133}\text{I}$ ,  $^{126}\text{Sn}$ ,  $^{110m}\text{Ag}$ ,  $^{127}\text{Sb}$ ,  $^{132}\text{Te}$ ,  $^{136}\text{Cs}$ ,  $^{129}\text{Te}$ ,  $^{129m}\text{Te}$ ,  $^{127}\text{Te}$ ,  $^{125}\text{Sb}$ ,  $^{135}\text{I}$ ,  
 $^{103}\text{Ru}$ ,  $^{147}\text{Pm}$ ,  $^{242}\text{Cm}$  and  $^{144}\text{Ce}$ .

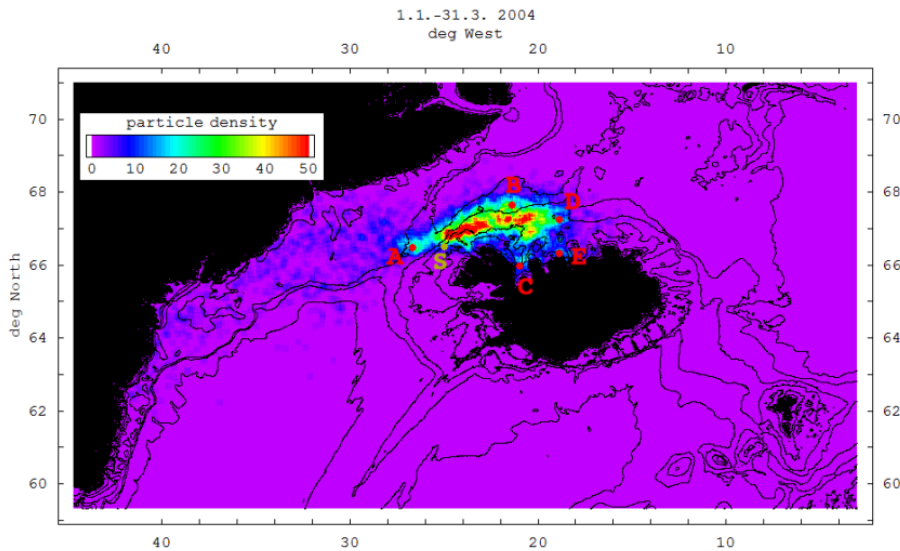

# Hypothesis for improvement

- **Development and implementation of the bioaccumulation process into the models**
- **Evaluation of the seasonality/time variability with following implementation into the models**

# Evaluation of the seasonality / time variability with following implementation into the models (3D CODE model)

**5000 particles; 40 experiments for each points**

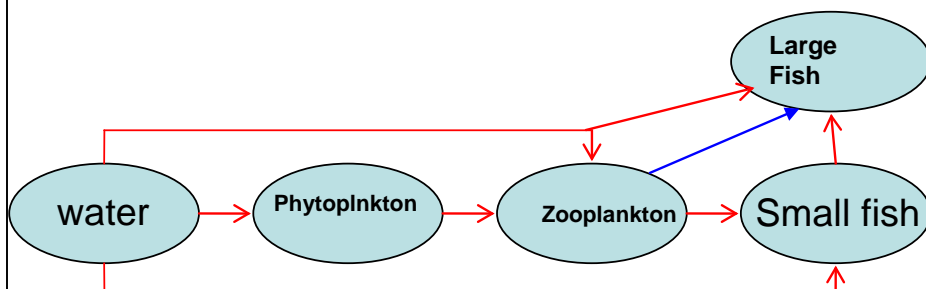

# Particle density, point A (2002-2014)

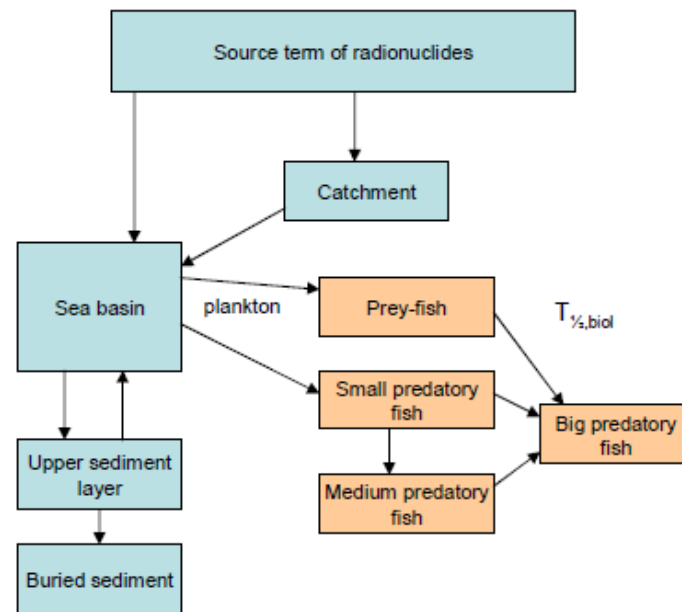

# Comparison between 3D CODE and Regional Iceland models

# Bioaccumulation submodels

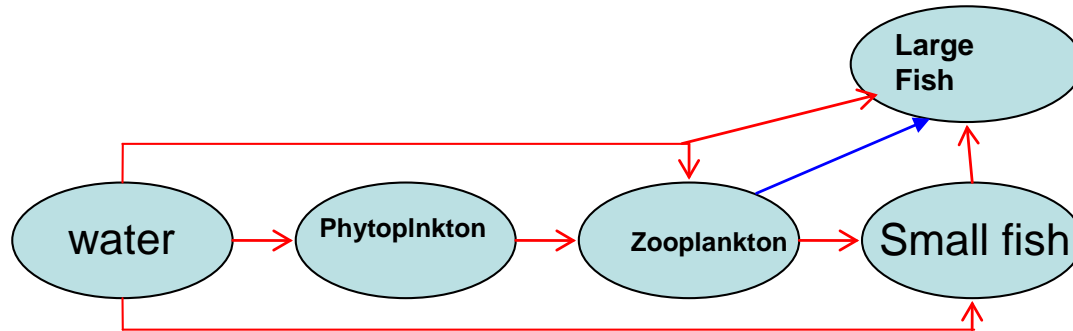

**Bioaccumulation model based on Thomann (1981)**

**Conceptual bioaccumulation model for the DETRA computer code**

# Case study: dynamic bioaccumulation submodel based on Thomann (1981)

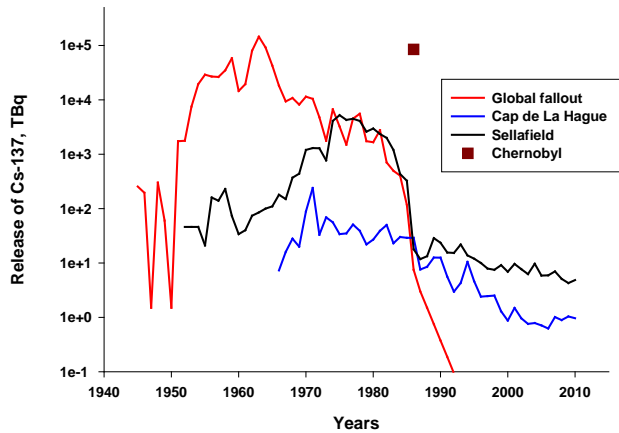

$$\frac{dC_i^{(tl)}}{dt} = AE_i \cdot IR_i \cdot C_{i-1}^{(tl)} + k_{u,i} \cdot C_w - C_i^{(tl)} \cdot k_{e,i}$$

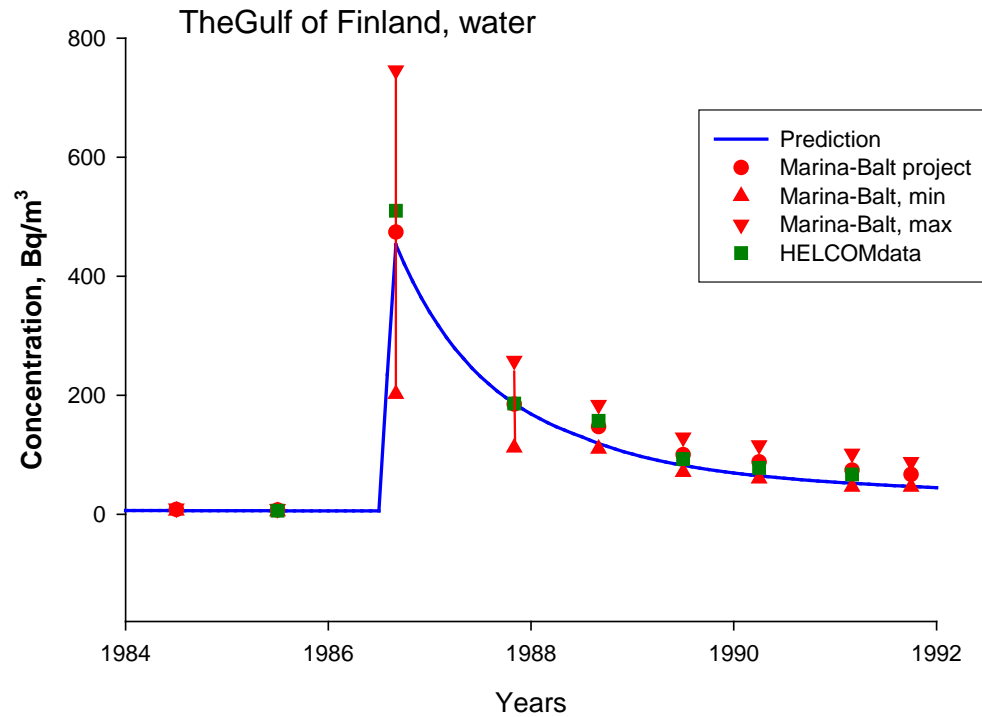

Here  $C_i^{(tl)}$  and  $C_{i-1}^{(tl)}$  – concentrations of radionuclide in trophic levels "i" and "i-1",  
 $C_w$  – concentration of radionuclide in water column,  
 $AE_i$  – the assimilation efficiency for trophic level "i",  
 $IR_i$  – ingestion per unit mass for trophic level "i",  
 $k_{u,i}$  – rate of the direct uptake of activity from water column for trophic level "i",  
 $k_{e,i}$  – the excretion rate for trophic level "i".

# Validation I: The Gulf of Finland

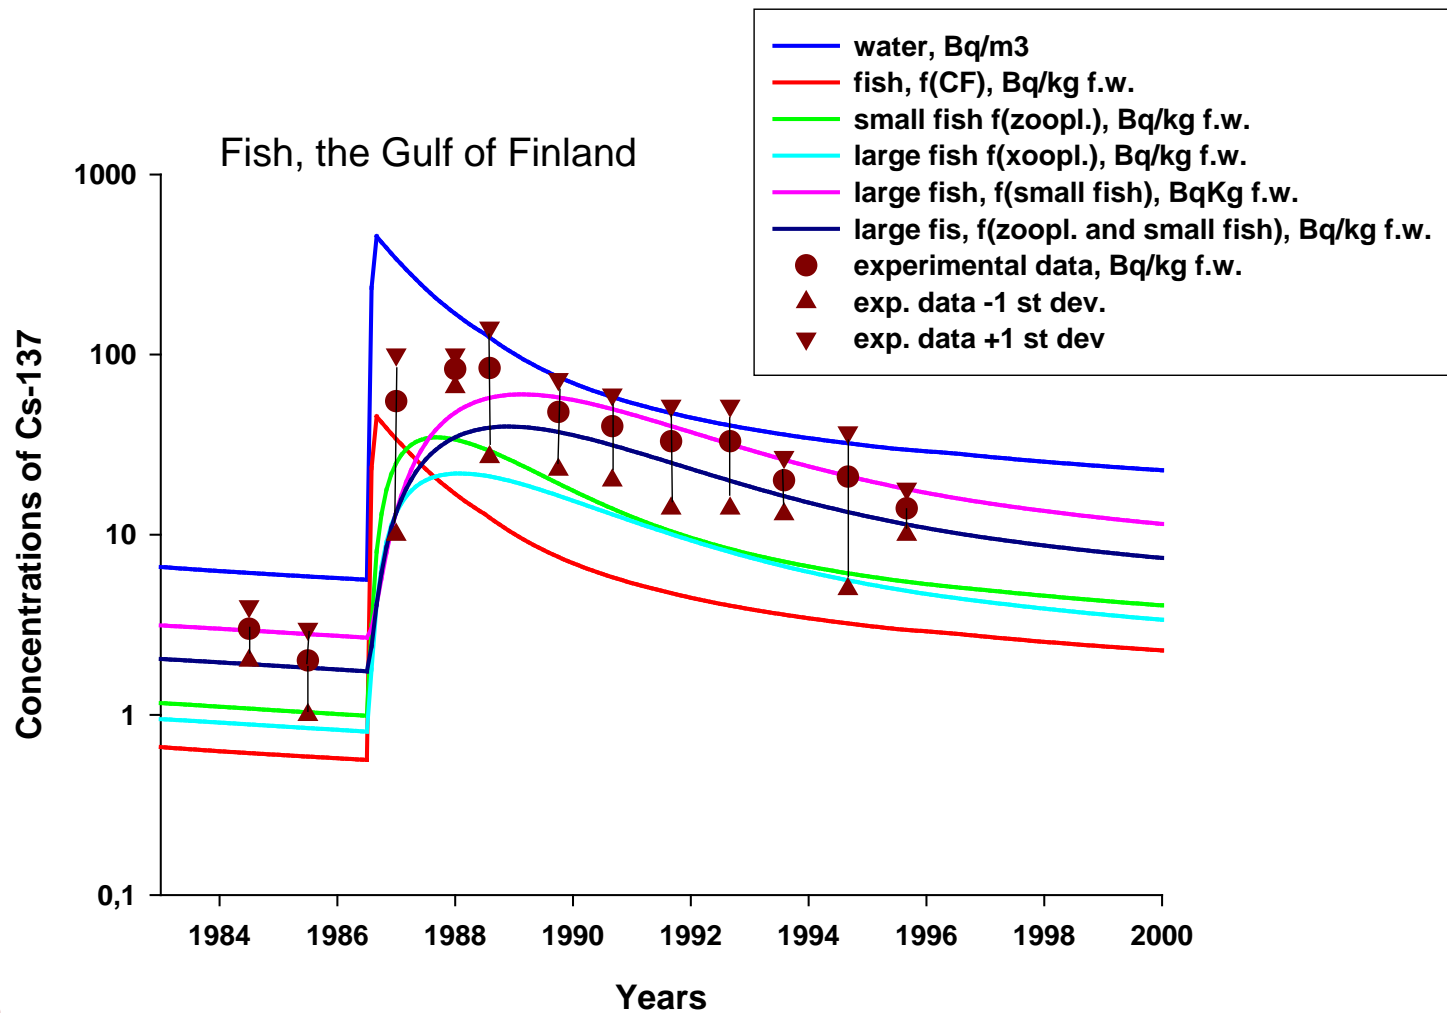

Sources

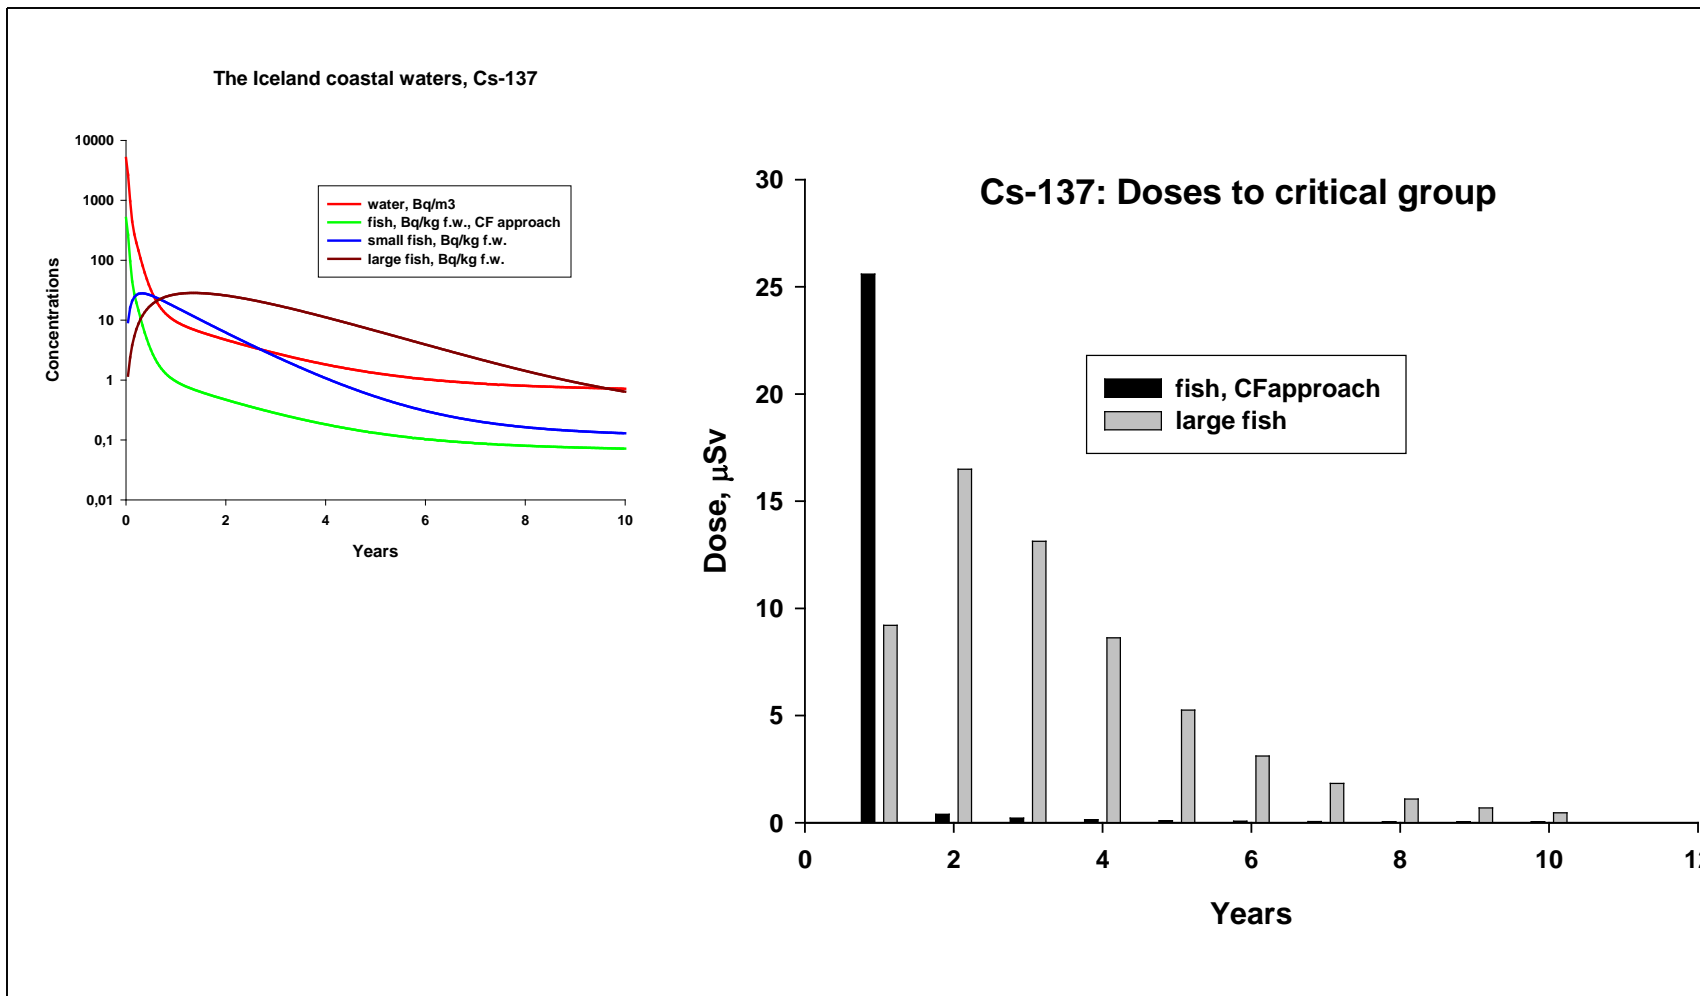

Concentration in seawater

# Validation II: The Gulf of Finland

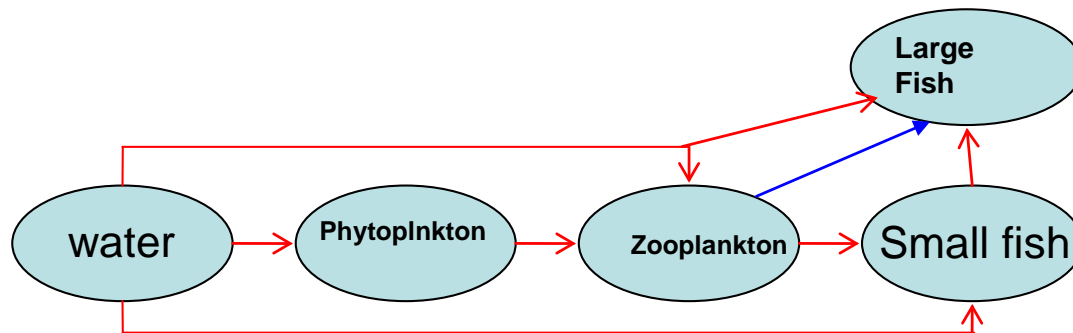

# Case study: the Iceland coastal waters

# Te-132

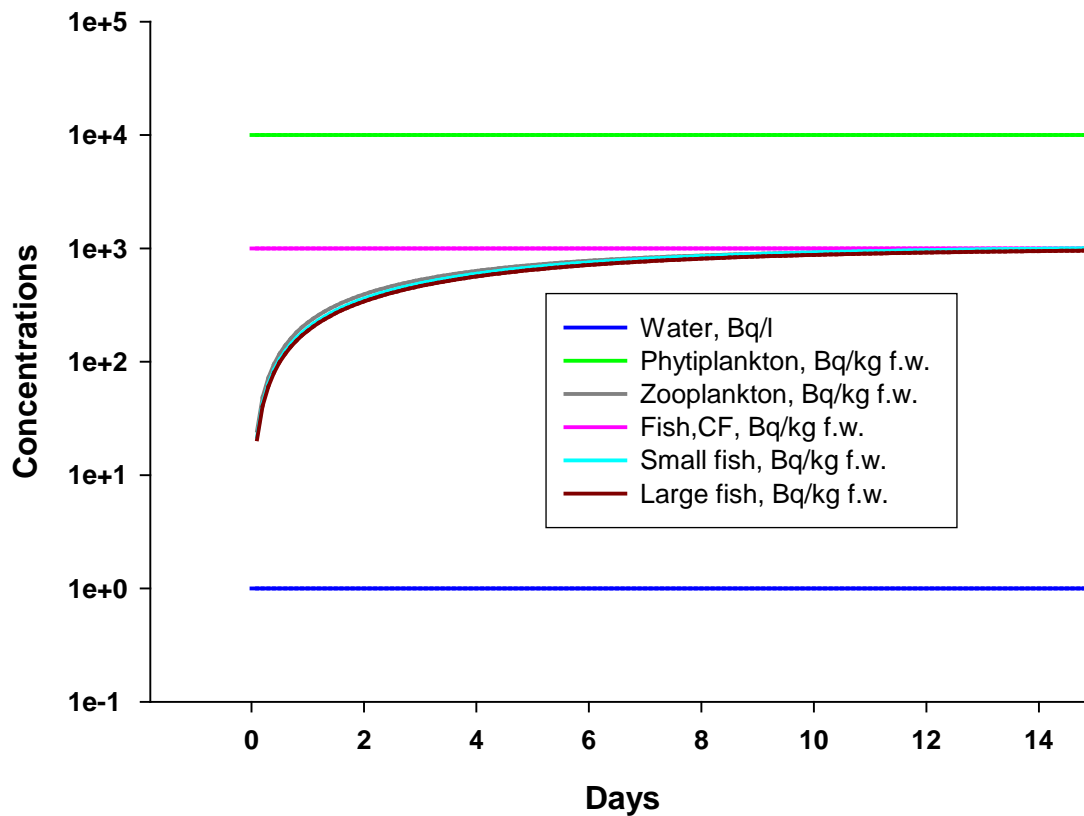

$$\frac{dC_i^{(tl)}}{t} = AE_i \cdot IR_i \cdot C_{i-1}^{(tl)} + k_{u,i} \cdot C_w - C_i^{(tl)} \cdot k_{e,i}$$

**Te-132 - ??????????????**

# Te-132: "equilibrium way"

# Te-132: "Equilibrium Way" for Submarine Accident Scenario

# Conclusions

**Results of implementation of the kinetic model for bioaccumulation processes into models clearly demonstrated that there is a significant quantitative difference between the kinetic modelling approach and the approach based on the constant concentration rates.**

**It is clearly demonstrated that dynamic modelling of the bioaccumulation processes can provide a more correct description of the concentration of radionuclides in biota and, therefore, these results support the main goal of the EFMARE project.**

**The results emphasize the necessity to use operational hydrodynamic ocean models in order to forecast pollutant dispersal in Icelandic waters with regards to evaluate the temporal variability . The use of particle density can be used for comparison and improvement of the modelling tools.**
